Market Overview

The global rates market experienced a broad-based bear steepening this week, with sovereign yields moving higher across the major developed markets and the long end clearly underperforming. While the front end of the curves also sold off, the move remained more contained as investors gradually scaled back expectations for further monetary tightening following a series of softer macroeconomic releases.

In the Eurozone, June flash inflation data surprised to the downside across the region. Headline HICP eased to 2.8% YoY from 3.2% previously and below the 3.0% consensus, while core inflation slowed to 2.4% YoY versus 2.6% previously and 2.5% expected. Inflation also came in below expectations in Germany and France, providing support to the front end of the curve and leading markets to price in less than 20bps of additional ECB tightening by year-end. At the ECB's annual Sintra Forum, policymakers nevertheless maintained a cautious tone, stressing that the recent oil price shock would continue to weigh on the inflation outlook. While the rhetoric remained relatively hawkish, it was largely in line with market expectations. President Christine Lagarde also noted that risks surrounding both inflation and growth had become more balanced, helping to limit the sell-off at the front end of the curve.

US Treasuries also experienced a bear steepening. Following stronger-than-expected May JOLTS job openings (7.59 million versus 7.30 million expected), the front end initially came under pressure before June Nonfarm Payrolls surprised sharply to the downside, with only 57k jobs created versus a consensus of 110k, while the previous month's figure was significantly revised lower. The weaker labour market data allowed the front end to outperform as investors modestly pared back expectations for additional Fed tightening. However, the move remained limited after Kevin Warsh reiterated at the Sintra Forum that the Fed remained firmly committed to restoring inflation to its 2% target and that an early policy easing remained unlikely. Meanwhile, long-end Treasury yields continued to move higher throughout the week.

Japan once again emerged as the main driver of the global bond sell-off. JGB yields rose sharply, particularly at the long end, amid persistent yen weakness, growing concerns that the Bank of Japan remains behind the curve in normalising monetary policy, and rising fears of a larger-than-expected fiscal expansion. Weak demand at several long-dated JGB auctions further exacerbated the move, with the 30-year JGB yield rising by around 22bps over the week. Through global spillover effects, the underperformance of the Japanese long end contributed significantly to the bear steepening observed across other developed sovereign bond markets.

In Europe, fiscal concerns also resurfaced after the OECD reiterated the fragile state of France's public finances, projecting the budget deficit to remain close to 5% of GDP in 2026 and highlighting the need for additional fiscal consolidation to stabilise the country's debt trajectory. Against this backdrop, the French 30-year OAT underperformed the broader EGB complex.

➤ **Macro Developments & Key Indicators**

US Treasuries experienced a bear steepening over the week, with the front end outperforming the long end despite yields moving higher across the curve. Early in the week, stronger-than-expected May JOLTS job openings (7.59 million versus 7.30 million expected) initially weighed on front-end Treasuries, reinforcing the view that labour market conditions remained relatively resilient despite signs of a broader economic slowdown. However, investors largely looked through the release ahead of the more closely watched June employment report.

The tone shifted later in the week after June Nonfarm Payrolls came in significantly below expectations, with only 57k jobs created versus a consensus of 110k, while May payrolls were revised sharply lower. Although average hourly earnings remained unchanged at 3.5% YoY and the unemployment rate edged down to 4.2%, the report reinforced the view that labour market momentum is gradually fading. As a result, the front end rallied, with markets modestly scaling back expectations for further Fed tightening.

Nevertheless, the move remained contained as Fed communication continued to anchor rate expectations. Speaking at the ECB's Sintra Forum, Kevin Warsh acknowledged that inflation risks had moderated in recent weeks but reiterated that the Federal Reserve remained fully committed to restoring inflation to its 2% target. His remarks were interpreted as less dovish than investors had anticipated, limiting the rally at the front end despite softer macroeconomic data. In parallel, the June ISM Manufacturing PMI unexpectedly declined to 53.3 from 54.0 previously, adding to evidence of a gradual moderation in economic activity without materially altering the Fed's policy outlook.

Meanwhile, the long end remained under sustained pressure throughout the week, with the 30-year Treasury yield rising by around 12bps to nearly 5.0%, marking its largest weekly increase since mid-May. Beyond domestic macroeconomic developments, long-dated Treasuries continued to be influenced by the sharp sell-off in Japanese government bonds, as growing concerns over Japan's fiscal outlook and the Bank of Japan's policy stance spilled over into global duration markets.

➤ **Rates Curve Movements**

- Swap spreads continued to cheapen this week, with the move concentrated in the belly and the long end of the curve. The 30Y swap spread tightened by 2bps over the week
- On a cross-market basis, the US curve once again underperformed the German curve across the entire term structure. The UST–Schatz 2Y spread widened by 2bps, while the UST–Bund 10Y spread increased by 2.3bps
- The US curve also steepened meaningfully, with the 2s30s UST slope widening by 7.3bps over the week

➤ **Trade ideas**

I continue to favour a **long US 10s30s steepener**.

The recent de-escalation in the Middle East broadly validates the framework behind the trade. From the outset of the conflict, the limited reaction in long-term inflation expectations, with the US 5y5y forward CPI breakeven remaining broadly stable, suggested that investors did not expect a lasting change in the medium-term inflation outlook despite concerns around energy prices and geopolitical risks. More recently, the 5y5y forward CPI breakeven has fallen below 2.40% as preliminary peace agreements have emerged, reinforcing the view that inflationary concerns linked to the conflict are fading.

While it remains important to monitor the situation closely, particularly the risk of setbacks that could undermine the current peace process, a durable ceasefire would likely allow market attention to shift back toward US fiscal fundamentals.

In that environment, I expect rising public debt, persistent fiscal deficits and heavy Treasury issuance to continue exerting upward pressure on long-end yields through a higher term premium. In addition, repeated attacks on Gulf infrastructure and the perception of a less reliable US security umbrella could encourage some reserve managers in the region to diversify part of their allocations away from US Treasuries, reducing a traditional source of structural demand for long-dated bonds.

As a result, I continue to see the long end as the most vulnerable part of the curve once fiscal concerns regain prominence. I therefore remain constructive on a long 10s30s steepener, with the 30Y sector likely to come under greater pressure than the 10Y sector.

➤ **Major Economic Data Releases – Week of June 29**

➤ **Macro Developments & Key Indicators**

Canadian government bonds broadly followed the bear steepening observed in US Treasuries over the week, although the move remained noticeably more contained. While global duration markets continued to be driven by developments in the US and Japan, Canadian rates benefited from resilient domestic demand and solid underlying fundamentals.

Investor sentiment towards Canadian sovereign debt remained particularly constructive, with foreign investors purchasing a record CAD 27.7bn of Government of Canada bonds in April, lifting their share of the market to an all-time high of 43%. This sustained appetite reflects both confidence in Canada's strong sovereign credit profile and a gradual diversification away from US Treasuries as concerns over the US fiscal trajectory continue to build. Strong foreign demand has also enabled the government to finance its ambitious investment programme under favourable funding conditions, despite a higher borrowing requirement.

That said, investors remain attentive to the evolving composition of demand. Hedge funds now account for an increasingly large share of both primary auctions and secondary market activity, making the Canadian bond market more exposed to potential deleveraging episodes. Although Canada's fiscal position remains one of the strongest among G7 economies, a sudden reversal in foreign or leveraged investor flows could become a source of volatility over the medium term.

Separately, the Bank of Canada announced a CAD 500m cash management repurchase operation scheduled for 7 July. The operation, which temporarily repurchases outstanding Government of Canada bonds to manage system liquidity, was viewed as a purely technical measure and did not alter expectations regarding the Bank's monetary policy outlook.

➤ **Rates Curve Movements**

- Canada outperformed the US across the curve this week, both in cash and derivatives. The UST–Canada 10Y cash spread widened by 5bps, while the USD–CAD 10Y swap spread increased by 4.5bps
- In cash, the 2s10s30s butterfly continued to cheapen, widening by 4.6bps over the week and by 7.3bps over the past two weeks

➤ **Macro Developments & Key Indicators**

Euro area government bonds broadly followed the global bear steepening trend over the week, although the move differed significantly across maturities. The front end initially outperformed following weaker-than-expected June flash inflation data across the region. Headline HICP eased to 2.8% YoY from 3.2% previously and below the 3.0% consensus, while core inflation slowed to 2.4% YoY versus 2.6% previously. Similar downside surprises in Germany and France reinforced expectations that the ECB is approaching the end of its tightening cycle, with markets pricing in less than 20bps of additional rate hikes by year-end.

Attention then shifted to the ECB's annual Sintra Forum, where policymakers maintained a cautious tone despite the recent improvement in inflation dynamics. Officials acknowledged that lower energy prices had helped rebalance risks to growth and inflation but reiterated that the recent oil shock could continue to feed through to consumer prices. President Christine Lagarde echoed this message, noting that inflation and growth risks had become more balanced while avoiding any clear signal that the ECB was ready to ease its policy stance. As a result, front-end yields remained relatively well anchored despite the broadly hawkish rhetoric.

Meanwhile, the belly and long end of the EGB curve increasingly traded as a function of global duration markets. Following the initial inflation-driven rally, longer maturities gradually sold off in sympathy with US Treasuries before coming under additional pressure from the sharp repricing in Japanese government bonds. The renewed sell-off in long-dated JGBs, fuelled by fiscal concerns and expectations that the Bank of Japan remains behind the curve, spilled over into European duration, resulting in a clear underperformance of the long end by the end of the week.

Domestic fiscal risks also resurfaced, particularly in France, after the OECD warned that the country's public finances remain on an unsustainable trajectory. The organisation expects France's fiscal deficit to remain around 5% of GDP in 2026, with public debt continuing to rise towards 119% of GDP, while estimating that an additional fiscal consolidation of around three percentage points of GDP will be required by 2030 to stabilise the debt ratio. Against this backdrop,

investors demanded a higher term premium on French duration, leading the 30-year OAT to underperform the broader EGB complex despite the more supportive inflation backdrop.

➤ **Rates Curve Movements**

- The Bund sold off by 8.4bps over the week, with the 10Y yield ending at 2.93%
- The German curve bear steepened, with the 2s30s slope widening by 7.7bps
- French long-end bonds underperformed across the EGB space, with the 30Y OAT–Buxl spread widening by 1.8bps
- Swap spreads cheapened across the curve, with the move concentrated in the front end and the belly. The Schatz swap spread tightened by 1.6bps, while the Bobl swap spread narrowed by 1.9bps

➤ **Trade ideas**

I remain constructive on France as a medium to long-term relative value theme and believe we may be approaching a more attractive entry point.

As with the US, I expect fiscal concerns to gradually return to the forefront of market pricing as tensions in the Middle East continue to ease. The preliminary ceasefire agreements between Israel and Iran have reduced the immediate geopolitical risk premium embedded in rates markets and, if sustained, should allow investors to refocus on underlying fiscal fundamentals.

While Germany's fiscal expansion has attracted significant attention, Berlin starts from a much stronger fiscal position and does not appear likely to concentrate issuance in the ultra-long end. As a result, the Bund long end may remain largely driven by structural demand and flow dynamics.

France appears particularly vulnerable given the growing possibility of a Rassemblement National victory in 2027. While the party's fiscal program remains relatively unclear, markets may increasingly question its willingness to adhere to European fiscal rules and pursue meaningful deficit reduction. In that scenario, investors could start demanding a higher fiscal risk premium on French debt, particularly at the long end where future supply concerns would be felt most acutely.

In this context, I would expect the French long end to underperform as investors demand a higher fiscal risk premium and price in greater long-dated issuance pressure.

The preferred expression of this view is a **long France-Germany 10s30s box steepener**, implemented through buying the OAT 10s30s steepener against selling the Bund 10s30s steepener.

➤ **Macro developments & Key Indicators**

UK government bonds also experienced a bear steepening over the week, although the move was noticeably less pronounced than across other major sovereign bond markets. Gilts outperformed both US Treasuries and core EGBs, with softer domestic macroeconomic data providing some support to the front end of the curve amid a broader global duration sell-off.

Recent economic releases pointed to a continued moderation in activity. Final Q1 GDP growth was revised down to 0.9% YoY from 1.1% previously, while the June S&P Global Manufacturing PMI edged down to 52.5 from 53.1. Although the manufacturing sector remained in expansionary territory, the softer reading suggests that momentum is gradually easing. Meanwhile, the Composite PMI slipped marginally to 49.3 from 49.4, highlighting that overall business activity remains subdued.

Against this backdrop, the front end of the gilt curve remained relatively resilient, while longer maturities increasingly tracked developments in global duration markets. As the week progressed, upward pressure on long-dated US Treasury yields, coupled with the sharp repricing in Japanese government bonds, spilled over into Gilts, weighing primarily on the long end of the curve. Consequently, the UK yield curve bear steepened over the week, albeit to a lesser extent than its developed market peers.

➤ **Rates curve movements**

- The Gilt curve bear steepened over the week, with the 2s30s slope widening by 6.7bps
- The cross-market Gilt–Buxl spread partially retraced its recent widening, tightening by 3.3bps this week after having widened by 3.9bps previously
- Swap spreads also cheapened across the curve, with the move concentrated in the front end. The 2Y Gilt swap spread tightened by 1.8bps

➤ **Major Economic Data Releases – Week of June 29**

➤ **Macro developments & Key Indicators**

Japanese government bonds significantly underperformed global sovereign bond markets this week, with the curve experiencing a pronounced bear steepening led by the long end. While the 2-year sector briefly outperformed following a stronger-than-expected auction, longer maturities remained under sustained pressure throughout the week, with the 30-year JGB yield rising by around 22bps. The repricing in Japanese duration subsequently spilled over into other developed bond markets, becoming one of the main drivers of the global bear steepening observed over the week.

The sell-off was primarily driven by growing concerns over Japan's fiscal outlook and the Bank of Japan's policy stance. Markets increasingly questioned whether the BoJ is falling behind the curve as persistent yen weakness continues to fuel imported inflation. The Japanese currency depreciated to its weakest level against the US dollar since 1986, reinforcing expectations that inflationary pressures could remain elevated should the BoJ maintain its cautious approach to policy normalisation. Meanwhile, the appointment of Ayano Sato to the BoJ's policy board, widely perceived as favouring a more accommodative stance, raised expectations that the BoJ could remain behind the curve, delaying further policy normalisation despite mounting inflationary pressures.

Fiscal developments also remained at the forefront of investors' attention. Concerns intensified after reports that the government could unveil additional fiscal stimulus while encouraging the BoJ to align its policy more closely with its growth agenda. Although the Ministry of Finance decided against modifying its JGB issuance programme during its mid-year review, markets remained focused on the prospect of higher borrowing needs over the coming quarters. These concerns were compounded by weak demand at long-dated auctions, most notably the 10-year reopening, where the auction tail widened from 5 to 20 cents, signalling a sharp deterioration in investor demand. According to Mizuho Securities, uncertainty surrounding a potential supplementary budget is likely to persist until the autumn, leaving upward pressure on JGB yields in place.

➤ **Rates curve movements**

- The Japanese long end significantly underperformed, with the 30Y JGB yield rising by 22bps. As a result, the 30Y JGB–Buxl spread widened by 12bps.
- The 2s10s30s JGB cash butterfly fully retraced its recent richening, cheapening by 13.7bps over the week

Appendix

All figures referenced in the commentary are sourced from Reuters, primarily via the Excel file presented below, which is linked using Reuters formulas. As this is based on the student version of the Reuters Terminal, some quotations may be slightly inaccurate, particularly within the European core and semi-core segments. As a result, movements in the yield curves (2Y, 5Y, 10Y, 30Y) may occasionally appear strange.

Data corresponds to bid prices as of market closing on Friday, June 26 and Friday, July 03.
