Market Overview

The week was dominated by two key themes: developments in the Middle East geopolitical landscape and a particularly busy central bank calendar. Early in the week, the announcement of a preliminary agreement between the United States and Iran aimed at ending the conflict and reopening the Strait of Hormuz triggered a broad rally across global fixed income markets. The resulting decline in oil prices led investors to modestly scale back inflation concerns linked to the energy shock that has weighed on the outlook in recent months. However, this move gradually lost momentum over the course of the week before reversing on Friday, following the cancellation of scheduled talks between Washington and Tehran and renewed tensions in the Middle East, prompting a broad-based sell-off across global bond markets.

Against this backdrop, major central banks continued to monitor the risk of the energy shock feeding through to the broader economy. Following the Bank of Canada's decision the previous week and the ECB's rate hike, which made it the first major central bank to tighten policy since the outbreak of the Iran conflict, the Bank of Japan, the Bank of England and the Federal Reserve all delivered their monetary policy decisions. The BoJ continued its policy normalization process by raising its policy rate to 1%, while both the Fed and the BoE left rates unchanged. Despite the temporary pullback in oil prices, both institutions emphasized that the inflationary effects of the conflict could continue to materialize in the coming months, particularly if diplomatic progress fails to translate into a lasting agreement.

Market attention was primarily focused on Kevin Warsh's first FOMC meeting as Fed Chair. While the decision to leave rates unchanged was widely expected, the overall tone of the meeting was perceived as notably more hawkish. The Fed's updated projections showed a significant upward revision to the inflation outlook, while the dot plot now points to a more restrictive policy bias than previously anticipated. Warsh also announced a series of reviews covering several aspects of the Federal Reserve's framework, particularly its communication strategy. Advocating for a Fed that relies less on forward guidance, he signaled a future policy framework characterized by greater uncertainty around the path of interest rates.

In the UK, gilts experienced a particularly volatile week. After benefiting early on from lower energy prices and softer-than-expected May inflation data, the market came under significant pressure on Friday amid renewed political uncertainty. Andy Burnham's election to the House of Commons reignited questions surrounding the future of the Starmer government and the UK's fiscal trajectory, with investors concerned that a shift in the political balance could pave the way for a more expansionary fiscal stance at a time when the sustainability of the UK's public finances remains under close scrutiny.

➤ Macro Developments & Key Indicators

US Treasuries started the week on a firmer footing, supported by a sharp decline in oil prices following the announcement of a preliminary agreement between Washington and Tehran aimed at ending the conflict and reopening the Strait of Hormuz. While the geopolitical de-escalation temporarily eased concerns surrounding the energy shock, investors remained cautious regarding its implications for US monetary policy. The consensus continued to favor a Fed hold, as lower oil prices alone were not seen as sufficient to materially alter the medium-term inflation outlook.

Economic data released ahead of the FOMC meeting reinforced this cautious stance. On the one hand, import prices surprised to the upside in May, highlighting that inflationary pressures remain present across parts of the economy. On the other hand, housing activity continued to soften, with housing starts posting a sharp decline. Overall, incoming data still point to an economy gradually losing momentum, though not yet showing the degree of weakness that would warrant a shift toward monetary easing.

As widely expected, Kevin Warsh's first FOMC meeting as Fed Chair resulted in rates being left unchanged. However, markets interpreted the overall message as significantly more hawkish than anticipated. Treasury yields moved higher, particularly across the front-end and belly of the curve, following projections that showed a meaningful upward revision to the inflation outlook. The updated dot plot also reinforced the Committee's hawkish bias, with half of FOMC participants now expecting at least one additional rate hike by the end of 2026.

Beyond the policy decision itself, investors focused on Warsh's plans to reshape several aspects of the Federal Reserve's framework. The new Chair announced a broad review of the Fed's communication strategy, reiterating his long-standing criticism of forward guidance, which he views as overly constraining for policymakers. Combined with the reviews of the balance sheet framework, economic modelling and inflation-targeting regime, these initiatives could mark the beginning of a Federal Reserve that is less predictable and more data-dependent than under the Powell era. For markets, this first meeting under Warsh ultimately confirmed that, despite the recent easing in energy prices, the Fed remains firmly focused on inflation risks and is not yet prepared to contemplate a shift toward monetary easing.

➤ Rates Curve Movements

- The U.S. short end underperformed on a cross-market basis, with the 2Y UST yield up 9.4bps and the UST-Schatz spread widening by 6.87bps
- The U.S. long end outperformed cross-market, as the U.S. market was closed on Friday and therefore did not participate in the sell-off, with the 30Y UST yield down 7.2bps and the UST-Buxl spread narrowing by 5.7bps
- The UST curve bear-flattened, with the 2s10s spread compressing by 12.8bps

➤ **Trade ideas**

I continue to favour a **long US 10s30s steepener**.

The recent de-escalation in the Middle East broadly validates the framework behind the trade. From the outset of the conflict, the limited reaction in long-term inflation expectations, with the US 5y5y forward CPI breakeven remaining broadly stable, suggested that investors did not expect a lasting change in the medium-term inflation outlook despite concerns around energy prices and geopolitical risks. More recently, the 5y5y forward CPI breakeven has fallen below 2.40% as preliminary peace agreements have emerged, reinforcing the view that inflationary concerns linked to the conflict are fading.

While it remains important to monitor the situation closely, particularly the risk of setbacks that could undermine the current peace process, a durable ceasefire would likely allow market attention to shift back toward US fiscal fundamentals.

In that environment, I expect rising public debt, persistent fiscal deficits and heavy Treasury issuance to continue exerting upward pressure on long-end yields through a higher term premium. In addition, repeated attacks on Gulf infrastructure and the perception of a less reliable US security umbrella could encourage some reserve managers in the region to diversify part of their allocations away from US Treasuries, reducing a traditional source of structural demand for long-dated bonds.

As a result, I continue to see the long end as the most vulnerable part of the curve once fiscal concerns regain prominence. I therefore remain constructive on a long 10s30s steepener, with the 30Y sector likely to come under greater pressure than the 10Y sector.

➤ **Macro Developments & Key Indicators**

Canadian government bonds largely traded in line with broader global fixed income markets this week, with price action primarily driven by geopolitical developments in the Middle East. Similar to other major sovereign bond markets, Canadian yields initially moved lower following the announcement of a preliminary agreement between the United States and Iran aimed at ending the conflict and reopening the Strait of Hormuz. The resulting decline in oil prices helped ease concerns over a prolonged energy shock and its potential inflationary consequences.

Following the Bank of Canada's decision to leave rates unchanged the previous week, investors remained more focused on geopolitical developments than on near-term monetary policy expectations. As in other developed markets, however, the prospect of a sustained easing in inflationary pressures continued to be viewed with caution, with market participants awaiting more tangible evidence before materially reassessing the rate outlook.

Beyond market performance, several reports highlighted the changing investor base in the Canadian sovereign bond market. Hedge funds, which were virtually absent from federal bond auctions a decade ago, are now estimated to account for between 30% and 50% of demand at certain auctions. While their growing presence is generally viewed as supportive of market liquidity, it has also raised questions about the increasing concentration of demand among a single category of investors. In an environment where fixed income volatility remains elevated, some market participants have pointed to this trend as a potential source of vulnerability during future periods of market stress.

➤ **Rates Curve Movements**

- The belly and the long end closed the week broadly unchanged, with yields ranging between 0bp and -0.5bp, while the front end sold off by around 2bps
- The 2s10s30s fly richened by 2.6bps.

➤ **Macro Developments & Key Indicators**

EGBs started the week on a positive note, benefiting alongside their US counterparts from the announcement of a preliminary agreement between the United States and Iran. The prospect of a reopening of the Strait of Hormuz and the sharp decline in oil prices triggered a broad-based rally across EGB markets, pushing yields lower during the first half of the week.

However, this move gradually came into conflict with monetary policy expectations. Despite the diplomatic progress observed in the Middle East, markets continue to price in the possibility of an additional ECB rate hike this year following last week's 25bp increase. Several Governing Council members also maintained a relatively hawkish tone, arguing that it remains too early to conclude that inflation risks stemming from the energy shock have fully dissipated.

As a result, the German yield curve experienced a twist flattening over the course of the week, with front-end yields moving higher on the back of tightening expectations while longer maturities remained relatively better anchored. These dynamic highlights the dilemma facing investors: geopolitical developments may be reducing near-term energy risks, but they have yet to materially challenge the prospect of an ECB that remains firmly focused on inflation.

EGBs eventually came under pressure towards the end of the week following the cancellation of scheduled talks between US and Iranian negotiators and renewed tensions in the Middle East. The move was further amplified by comments from Pierre Wunsch and Philip Lane, both of whom reiterated that the ECB retains scope to tighten policy further should inflationary pressures begin to spread beyond the energy sector.

➤ **Rates Curve Movements**

- The 10Y Bund yield declined by 1.5bps, appearing to stabilise below the 3% level
- The German curve twist-flattened, with the 2s30s spread narrowing by 4.1bps
- Swap spreads cheapened across the curve, with the Schatz ASW spread tightening by 1bp and the Bund ASW spread narrowing by 1.6bps
- Peripheral bonds outperformed, with credit spreads tightening across the curve. The BTP-Schatz spread narrowed by 1.7bps, while the SPGB-Buxl spread tightened by 1.8bps

➤ **Trade ideas**

I remain constructive on France as a medium to long-term relative value theme and believe we may be approaching a more attractive entry point.

As with the US, I expect fiscal concerns to gradually return to the forefront of market pricing as tensions in the Middle East continue to ease. The preliminary ceasefire agreements between Israel and Iran have reduced the immediate geopolitical risk premium embedded in rates markets and, if sustained, should allow investors to refocus on underlying fiscal fundamentals.

While Germany's fiscal expansion has attracted significant attention, Berlin starts from a much stronger fiscal position and does not appear likely to concentrate issuance in the ultra-long end. As a result, the Bund long end may remain largely driven by structural demand and flow dynamics.

France appears particularly vulnerable given the growing possibility of a Rassemblement National victory in 2027. While the party's fiscal program remains relatively unclear, markets may increasingly question its willingness to adhere to European fiscal rules and pursue meaningful deficit reduction. In that scenario, investors could start demanding a higher fiscal risk premium on French debt, particularly at the long end where future supply concerns would be felt most acutely.

In this context, I would expect the French long end to underperform as investors demand a higher fiscal risk premium and price in greater long-dated issuance pressure.

The preferred expression of this view is a **long France-Germany 10s30s box steepener**, implemented through buying the OAT 10s30s steepener against selling the Bund 10s30s steepener.

➤ Macro developments & Key Indicators

Gilts experienced a particularly volatile week, initially outperforming their European peers as a combination of lower energy prices and softer-than-expected May inflation data provided support to the market. Given the UK's sensitivity to developments in energy markets, the preliminary agreement between the United States and Iran and the prospect of a reopening of the Strait of Hormuz were viewed as particularly supportive for the inflation outlook, triggering a strong rally across the gilt curve early in the week.

The BoE delivered no major surprises, keeping Bank Rate unchanged at 3.75%. However, the overall tone remained cautious. While policymakers acknowledged the recent decline in energy prices, Andrew Bailey reiterated that it was still too early to conclude that inflation risks had fully dissipated. Updated BoE projections continue to point to inflation remaining above target over the coming quarters, albeit at lower levels than those envisaged during the peak of the recent energy shock.

Despite three dissenting votes in favour of a 25bp rate hike, markets largely interpreted the meeting as confirmation that the BoE remains committed to what Bailey has described as an "active pause". As a result, investors focused less on the policy decision itself and more on geopolitical developments and domestic political risks.

The latter ultimately dominated market sentiment towards the end of the week. Gilts came under significant pressure following Andy Burnham's election to the House of Commons, which fuelled concerns that a weakening of the Starmer government could increase the likelihood of a more expansionary fiscal stance. The sell-off was particularly pronounced at the long end of the curve, despite the BoE's confirmation that it would not conduct any long-dated gilt sales during the next quarter. The move highlighted the market's continued sensitivity to fiscal sustainability concerns, which remain a key risk factor for UK government bonds.

➤ Rates curve movements

- The long end underperformed relative to its European peers, with the Gilt-Buxl spread widening by 2bps, while the front-end outperformed Germany, as reflected by a 1.4bp tightening in the Gilt-Schatz spread
- The 2s10s swap curve bear-flattened, with the spread narrowing by 1.9bps

➤ **Macro developments & Key Indicators**

JGBs started the week on a firmer footing alongside other major sovereign bond markets, benefiting from the decline in oil prices following the announcement of a preliminary agreement between the United States and Iran. The prospect of a reopening of the Strait of Hormuz temporarily eased concerns surrounding the energy shock, supporting lower yields at the start of the week.

Investor attention quickly shifted to the Bank of Japan's policy meeting. As widely expected, the BoJ raised its policy rate to 1%, its highest level in more than three decades, continuing the normalization process initiated in recent quarters. While the central bank acknowledged that improving geopolitical conditions had reduced some near-term risks to the economy, it maintained a firm focus on inflation. Shinichi Uchida notably indicated that further rate hikes remain possible should inflationary pressures continue to build.

This view was reinforced by the persistence of several domestic inflation drivers. Investors continue to monitor the pace at which companies are passing higher energy costs through to final prices, while the continued weakness of the yen remains a source of imported inflation. Despite the provisional peace agreement, markets therefore continue to view the BoJ's tightening cycle as unfinished.

Notably, JGBs came under pressure across the belly and long end of the curve despite the BoJ's decision to suspend the gradual reduction of its bond purchases from next April and maintain monthly purchases of roughly JPY 2 trillion. The move appeared to reflect both expectations of further policy tightening and concerns surrounding the government's fiscal stance following the announcement of additional spending measures aimed at offsetting rising energy costs. Markets ultimately focused more on the prospect of additional rate hikes and concerns over increased fiscal spending than on the accommodative nature of the BoJ's asset purchase announcement.

➤ **Rates curve movements**

- In contrast to other government bond curves, the Japanese curve experienced a twist steepening, with the JGB 2s30s slope widening by 4bps
- Swap spreads richened across the curve, with the move particularly pronounced in the belly, where the 5Y swap spread widened by 6.3bps

Appendix

All figures referenced in the commentary are sourced from Reuters, primarily via the Excel file presented below, which is linked using Reuters formulas. As this is based on the student version of the Reuters Terminal, some quotations may be slightly inaccurate, particularly within the European core and semi-core segments. As a result, movements in the yield curves (2Y, 5Y, 10Y, 30Y) may occasionally appear strange.

Data corresponds to bid prices as of market closing on Friday, June 19 and Friday, June 12.
