Market Overview

Rates markets experienced another broad global sell-off this week, as renewed tensions around US–Iran negotiations triggered a fresh rise in oil prices and reignited inflation concerns across major economies. The move was not limited to the front end of curves: while short maturities repriced higher policy rate expectations amid growing fears of second-round inflation effects, long-end yields also moved sharply higher as markets increasingly embraced a more persistent “higher-for-longer” regime globally.

Throughout the week, investors progressively increased their expectations for further rate hikes across major central banks. Several ECB officials warned that they stood ready to react should higher energy prices feed more durably into inflation, while in Japan rising oil prices, persistent yen weakness and stronger inflation dynamics reinforced expectations of faster BoJ normalization. In the US, stronger-than-expected CPI and PPI data further supported the repricing of Fed expectations, with traders increasingly pushing toward additional tightening expectations into 2027. Markets also closely monitored the Senate confirmation of Kevin Warsh as Fed governor, viewing it as an important step toward his possible succession to Jerome Powell and raising questions around the future policy direction of the Fed.

At the same time, fiscal and supply concerns remained an important driver of the bearish move in global bond markets. Large US Treasury issuance was met with only mediocre demand, particularly on the long end, while investors increasingly focused on the growing cost of servicing debt in an environment of elevated short-term rates and widening fiscal deficits. Similar concerns also remained present in the UK and Japan, where markets continued to demand higher term premia amid uncertainty around future borrowing needs and potential fiscal expansion.

Importantly, the late-week sell-off in Treasuries appeared increasingly driven by real yields rather than inflation breakevens, suggesting that markets continue to view the US economy as resilient despite restrictive financial conditions. This further reinforced the idea that central banks, particularly the Fed, may be able to maintain elevated policy rates for longer than previously expected.

➤ Macro Developments & Key Indicators

US Treasuries experienced another broad sell-off this week, initially driven by renewed geopolitical tensions after Donald Trump quickly rejected Iran's response to a US peace proposal. The resulting rise in oil prices reignited inflation fears globally and pushed markets to significantly reprice the Fed path, with investors increasingly reducing expectations for rate cuts while progressively raising the probability of further tightening over the coming quarters. The move was visible across the entire curve: the front end underperformed as higher inflation risks led to a repricing of Fed expectations, while the long end also came under pressure as markets embraced a more persistent "higher-for-longer" regime.

The bearish move in Treasuries was reinforced by stronger-than-expected US inflation data during the week. April CPI surprised to the upside, with annual inflation accelerating at its fastest pace in three years, while April PPI recorded its strongest monthly increase since early 2022. Although some strategists argued that slowing income dynamics and relatively anchored long-term inflation expectations should limit the risk of a full second-round inflation spiral, traders nevertheless continued to increase expectations for additional Fed tightening into H1 2027

IMPLIED RATES & BASIS POINTS

From Fed cuts to Fed hikes: the market narrative has flipped (Source: FF Futures; Reuters 17 May)

Supply dynamics also remained a major focus throughout the week. The US Treasury issued \$125bn of debt across 3y, 10y and 30y maturities, with auctions generally met with only mediocre demand. Tuesday's \$42bn 10y auction recorded its weakest bid-to-cover ratio since February, while Wednesday's \$25bn 30y auction also tailed and produced the weakest bid-to-cover ratio since November. These soft auctions reinforced investor concerns over the growing amount of duration that markets must absorb at a time when fiscal deficits continue to widen and borrowing needs remain elevated.

Beyond near-term supply pressures, markets increasingly focused on the structural deterioration of US public finances. Around 85% of Treasury issuance since the beginning of the year has been concentrated in short-term maturities, the highest proportion since 2008, leaving the US government increasingly exposed to elevated front-end

rates. Investors continued to debate the risk of a vicious circle in which higher rates increase debt servicing costs, further widening deficits and requiring even larger debt issuance in the future.

Markets also closely monitored the confirmation of Kevin Warsh as Fed governor, viewing it as an important step toward a possible succession to Jerome Powell. Investors remain uncertain whether Warsh will ultimately adopt a more politically aligned and dovish stance closer to Stephen Miran's approach or instead maintain a more traditional inflation-focused policy framework. In parallel, discussions around future Fed balance sheet reduction also remained in focus, as growing fiscal deficits and heavy Treasury financing needs could complicate any attempt to accelerate quantitative tightening.

By the end of the week, another rise in oil prices following further negative headlines around US–Iran negotiations triggered a renewed sell-off in Treasuries. Importantly, the move increasingly appeared driven by higher real yields rather than inflation breakevens, suggesting that markets continue to believe the US economy can withstand elevated interest rates. This reinforced the view that the Fed may be able to maintain restrictive policy settings for longer, further supporting the global higher-for-longer narrative.

➤ **Rates Curve Movements**

- The belly of the curve underperformed, with the 10Y UST yield up 23bps and the UST 2s10s curve bear-steepening by 4bps.
- USTs underperformed versus the German curve across all maturities, with the 2Y UST-Schatz spread widening by 5.7bps and the 10Y UST-Bund spread widening by 8.2bps
- The 2s5s10s cash fly cheapened by 6.8 bps, while the 2s5s10s swap fly cheapened by 9.6bps

➤ **Trade ideas** (1) *trade ideas below have been developed with members of the Futures program, 2) The inspiration for the trade idea comes from Mizuho strategists)*

- 1) The trade idea is based on the view that tensions in the Middle East are likely to stabilize over time, even if that comes with Iran maintaining some degree of control over the Strait of Hormuz following its reopening. In that context, the inflation shock is likely to prove temporary, keeping long-term inflation expectations relatively anchored, as reflected in the US 5y5y Breakeven Forward CPI around 2.45%. As a result, the 10y sector should not materially underperform the long end.

However, repeated Iranian attacks on Gulf infrastructure and the perceived lack of U.S. support could lead Gulf states to reassess the reliability of the U.S. security umbrella and gradually diversify their alliances. This would put pressure on the petrodollar recycling mechanism and, by extension, on structural demand for U.S. Treasuries.

At the same time, the long end is already facing headwinds from rising U.S. debt and increased issuance. Taken together, these factors suggest additional pressure on the 30y sector, supporting a **long 10s30s USTs steepener position**.

- 2) Our trade has performed well so far, and I believe the position can still be maintained, as the market may continue to price in additional rate hikes into early 2027. While Warsh was initially perceived as dovish and his appointment by Trump was largely interpreted through that lens, he has also stressed his attachment to the Fed's independence. In this context, he may prove less willing to follow calls for lower rates, and markets could react strongly to any moderately hawkish comments.

So still **short SFRZ7 (SOFR Dec27)**

➤ Macro Developments & Key Indicators

The Canadian bond market was not spared from the global rates sell-off this week and largely moved in sympathy with the US Treasury curve.

Domestically, the week remained relatively light in terms of macroeconomic catalysts, with very few major data releases in Canada. As a result, markets were mainly driven by global rate moves and broader sentiment across sovereign bond markets.

The main event came on Tuesday with the release of the minutes from the Bank of Canada's April 29 meeting. The minutes confirmed a more cautious and slightly more hawkish tone from the central bank. Governing Council members judged that they could keep the policy rate unchanged at 2.25% for now, with inflation still close to the 2% target and economic growth remaining modest. However, the Bank stressed that the situation could evolve rapidly.

Discussions notably highlighted risks related to higher energy prices and their potential spillover effects on underlying inflation. The BoC acknowledged that additional monetary tightening could become necessary should inflationary pressures prove more persistent.

Markets mainly took away that the Bank of Canada is gradually moving away from a near-term rate cut scenario, while Tiff Macklem's comments about the possibility of consecutive rate hikes further reinforced the Bank's more hawkish stance. The market is currently pricing in slightly more than two additional rate hikes from the Bank of Canada by the end of 2026:

➤ Macro Developments & Key Indicators

EGBs remained under significant pressure this week, with EGB yields moving broadly higher as renewed tensions surrounding US–Iran negotiations reignited energy-driven inflation fears across the Eurozone. The sharp rebound in oil prices pushed markets to further reassess the ECB outlook, reinforcing expectations that the central bank may need to maintain restrictive policy settings for longer. The sell-off extended across the entire curve, with short-end yields repricing additional tightening expectations while long-end rates followed higher alongside the broader global higher-for-longer repricing.

Several ECB officials reinforced the central bank's hawkish stance during the week, warning that the ECB stood ready to react should higher energy prices feed more durably into broader inflation dynamics. Markets increasingly focused on the risk of second-round effects and a potential wage-price spiral if elevated energy prices persist, leading investors to further increase expectations for additional ECB tightening in June and later this year. The global repricing in rates markets, particularly following stronger-than-expected US CPI and PPI data, also contributed to upward pressure on EGB yields.

IMPLIED RATES & BASIS POINTS

The market is pricing in three-rate hikes by year-end through €STR swaps. Source : Reuters, May 17

Despite a brief relief rally on Thursday, European bonds resumed their sell-off into the end of the week after another rise in oil prices triggered by renewed negative headlines around US–Iran negotiations. While inflation concerns remained central to market pricing, some analysts, including Goldman Sachs, continued to argue that stable wage dynamics, weaker growth prospects and the ECB's already restrictive stance should help limit the risk of a sustained inflation spiral in the Eurozone.

➤ **Rates Curve Movements**

- Bear steepening in 2s10s EGB curves: +1.4bps on the German 2s10s curve
- Swap spreads widening: +4.7bps on the Bund spread
- Credit spreads tightening in Europe, with France underperforming: +8.2bps on the 10Y OAT-Bund spread (mainly driven by the 10Y benchmark switch from FRTR Nov-35 to FRTR Jun-37)
- In periphery Italy naturally underperformed during this sell-off: +7.8bps on the 10Y BTP-Bund spread, +4.3bps on the 10Y BTP-SPGB spread

➤ **Trade ideas** (own trade ideas)

- 1) I stick with last week's trade idea: **long Spain 10Y vs short Belgium 10Y**. The rationale remains intact: Spain continues to benefit from stronger fundamentals and a more favourable supply/demand backdrop, while Belgium looks relatively less supported.
- 2) It is indeed possible that the market is pricing relatively too much ECB tightening. While the ECB remains focused on bringing inflation down quickly and avoiding a repeat of the policy mistakes made during the Ukraine war shock, the ongoing slowdown in Eurozone growth and the still-limited evidence of second-round inflation effects, with wage dynamics remaining relatively stable so far, could justify fewer hikes being priced in by Dec-26. So **receive €STR Dec-26**.

➤ Macro developments & Key Indicators

Gilts remained under heavy pressure throughout the week, significantly underperforming other major sovereign bond markets as investors continued to demand a higher risk premium for holding UK debt. The sell-off was initially driven by the broader global repricing triggered by renewed tensions around US–Iran negotiations and the resulting rise in oil prices, which reinforced concerns that inflation could remain elevated for longer. However, domestic political and fiscal concerns once again played a central role in amplifying volatility in UK rates markets.

Markets increasingly focused on the growing uncertainty surrounding the future direction of UK fiscal policy. Investors fear that a potential successor to Prime Minister Keir Starmer could adopt a significantly more expansionary fiscal stance, increasing borrowing needs at a time when UK public finances are already under pressure. Memories of the 2022 Liz Truss crisis remained very present in markets, with investors still highly sensitive to any sign of unfunded fiscal expansion or deteriorating debt sustainability.

At the same time, the UK continues to be viewed as particularly vulnerable to renewed inflationary pressures due to its strong dependence on imported natural gas and energy prices. The renewed rise in oil prices linked to Middle East tensions reinforced expectations that UK inflation could remain significantly above target for longer, leading markets to further push back expectations for BoE easing and reinforcing the broader higher-for-longer repricing across the gilt curve.

IMPLIED RATES & BASIS POINTS			
	Meeting Date	Implied Rate	Basis Points
📄	18-Jun-2026	+3.8454	+11.3800
📄	30-Jul-2026	+3.9676	+23.6000
📄	17-Sep-2026	+4.1709	+43.9300
📄	05-Nov-2026	+4.2904	+55.8800
📄	17-Dec-2026	+4.3959	+66.4200

The SONIA swaps market is pricing in roughly 2.5 rate cuts of 25bps this year.

Structural factors also continued to contribute to gilt market fragility. Over recent years, the gradual decline of defined-benefit pension demand for long-dated gilts has reduced the stability of the traditional domestic investor base, leaving the market increasingly reliant on shorter-term and more price-sensitive foreign investors such as hedge funds. This has contributed to higher volatility and a greater sensitivity of UK rates to both global and domestic shocks, particularly on the long end.

Political uncertainty further intensified during the week after the resignation of the UK Health Secretary, who is expected to formally enter the Labour leadership race. Although Keir Starmer reiterated his intention to remain in office despite growing internal pressure, gilts continued to trade with a pronounced high-beta profile relative to broader global bond markets. By the end of the week, UK 10y yields remained above 5%, significantly higher than US Treasuries and

German Bunds, highlighting persistent investor concerns around the UK's fiscal outlook, political stability and inflation vulnerability.

➤ **Rates curve movements**

- Unlike EGBs and USTs, the 30Y Gilt underperformed the entire curve: +27.4bps. The 10Y Gilt was not spared either, rising +26.6bps to reach 5.18%
- -2.8bps on the 10Y Gilt spread
- The cash 2s10s30s fly cheapened by 8.1bps

➤ **Trade ideas**

- 1) Markets are more likely to price ECB hikes than BoE tightening, supported by Europe's lower starting point for rates and the BoE's labour market concerns.

We can therefore expect the €STR Dec27–Dec26 spread to compress, while the SONIA Dec27–Dec26 spread should widen.

In other words, we can favour a **long €STR Dec27–Dec26 flattener vs SONIA Dec27–Dec26 steepener**.

➤ Major Economic Data Releases – Week of May 11

Date	Indicator Name	Period	Reuters Poll	Actual	Prior
No Major economic data released					

➤ Macro developments & Key Indicators

Japanese government bonds experienced another sharp sell-off this week, with yields rising aggressively across the curve and the long end significantly underperforming. The move was initially driven by renewed tensions around US–Iran negotiations, which triggered another rise in oil prices and reignited inflation concerns in Japan given the country's heavy dependence on imported energy. Persistent yen weakness further amplified these pressures, reinforcing expectations that the BoJ may need to normalize policy more aggressively over the coming quarters.

Markets increasingly focused on the risk that higher energy prices could generate broader and more persistent inflationary pressures across the Japanese economy through second-round effects. As a result, expectations for further BoJ tightening continued to rise throughout the week, with some economists arguing that the upper bound of Japan's long-term neutral rate could eventually move toward 3%, above the BoJ's current upper-end estimate of 2.5%.

The sell-off was particularly pronounced on the long end of the curve, where investors also remained concerned about deteriorating fiscal dynamics and rising borrowing needs. Markets increasingly feared that additional fiscal support measures aimed at offsetting rising living costs could further increase debt issuance and upward pressure on long-term yields. Supply remained closely monitored throughout the week. Although the ¥600bn 30y auction ultimately attracted solid demand, it failed to prevent further upward pressure on yields.

By the end of the week, Japanese yields had reached multi-decade highs across several maturities. The 10y JGB yield rose to 2.73%, its highest level since 1997, while stronger-than-expected wholesale inflation data further reinforced expectations that the BoJ could move toward another tightening step as early as its June meeting.

IMPLIED RATES & BASIS POINTS				
	Meeting Date	Implied Rate	Basis Points	
📄	16-Jun-2026	+0.9119	+18.4700	
📄	31-Jul-2026	+0.9500	+22.2800	
📄	18-Sep-2026	+1.0282	+30.1000	
📄	30-Oct-2026	+1.0895	+36.2300	
📄	18-Dec-2026	+1.2382	+51.1000	

Almost one full rate hike is priced in for June in the TONA swaps market.

➤ Rates curve movements

- While the 2Y JGB outperformed on a cross-market basis, with the 2Y JGB-Schatz spread tightening by 9.8bps, the 30Y JGB underperformed cross-market: +17bps on the 30Y JGB-Buxl spread, +11bps on the 30Y JGB-UST spread and +2bps on the 30Y JGB-Gilt spread
- In this context, the Japanese curve experienced a sharp bear steepening: +25.6bps on the 2s30s JGB curve and +19.2bps on the 2s10s JGB curve

➤ **Trade ideas**

The 30Y swap spread richened by 1.6bps last week to reach -58bps. Given the country's fiscal and budgetary backdrop, it is highly likely that cash continues to underperform versus swaps, with the 30Y swap spread potentially widening further to -65bps.

So, I am **short 30Y JGB ASW**.

Appendix

All figures referenced in the commentary are sourced from Reuters, primarily via the Excel file presented below, which is linked using Reuters formulas. As this is based on the student version of the Reuters Terminal, some quotations may be slightly inaccurate, particularly within the European core and semi-core segments. As a result, movements in the yield curves (2Y, 5Y, 10Y, 30Y) may occasionally appear strange.

Data corresponds to bid prices as of market closing on Friday, May 8 and Friday, May 15.
